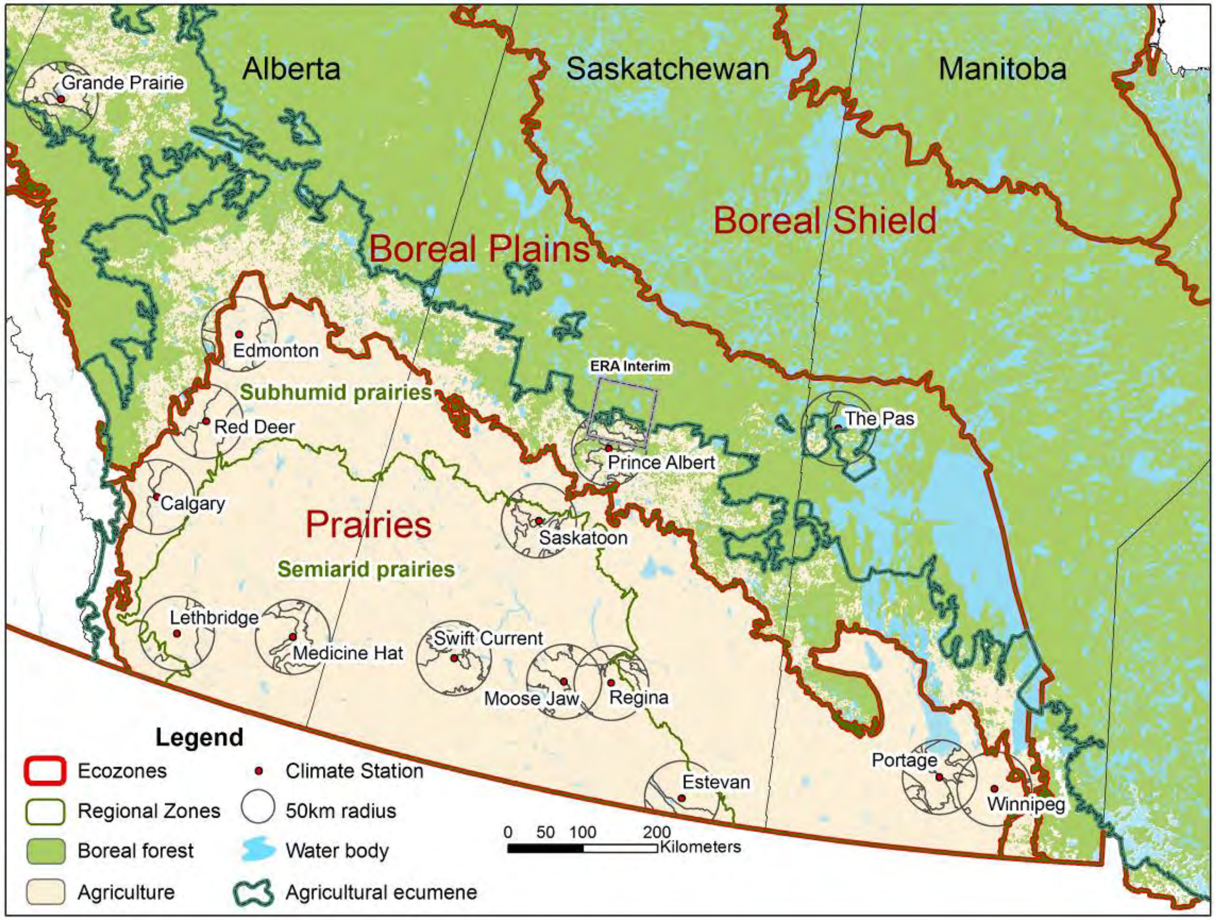
This talk

- ***Background:*** ***Remarkable 55-yr hourly data set with opaque/reflective cloud observations***

- **Northern latitude climate**
  - **Large seasonal cycle**
    - **Snow is a fast climate switch**
    - **Two separate “climates” - above and below the freezing point of water**
  - **Summer hydrometeorology**
    - **T and RH have joint dependence on radiation and precipitation on monthly timescales**
  - **Observational evaluation of reanalysis**

15 Prairie stations: 1953-2011



- *Hourly* **p, T, RH, WS, WD, Opaque Cloud by level, (SW_{dn}, LW_{dn})**
- *Daily* **precipitation and snowdepth**
- **Ecodistrict crop data since 1955**
- **Albedo data (MODIS/CCRS: 250m, after 2000)**

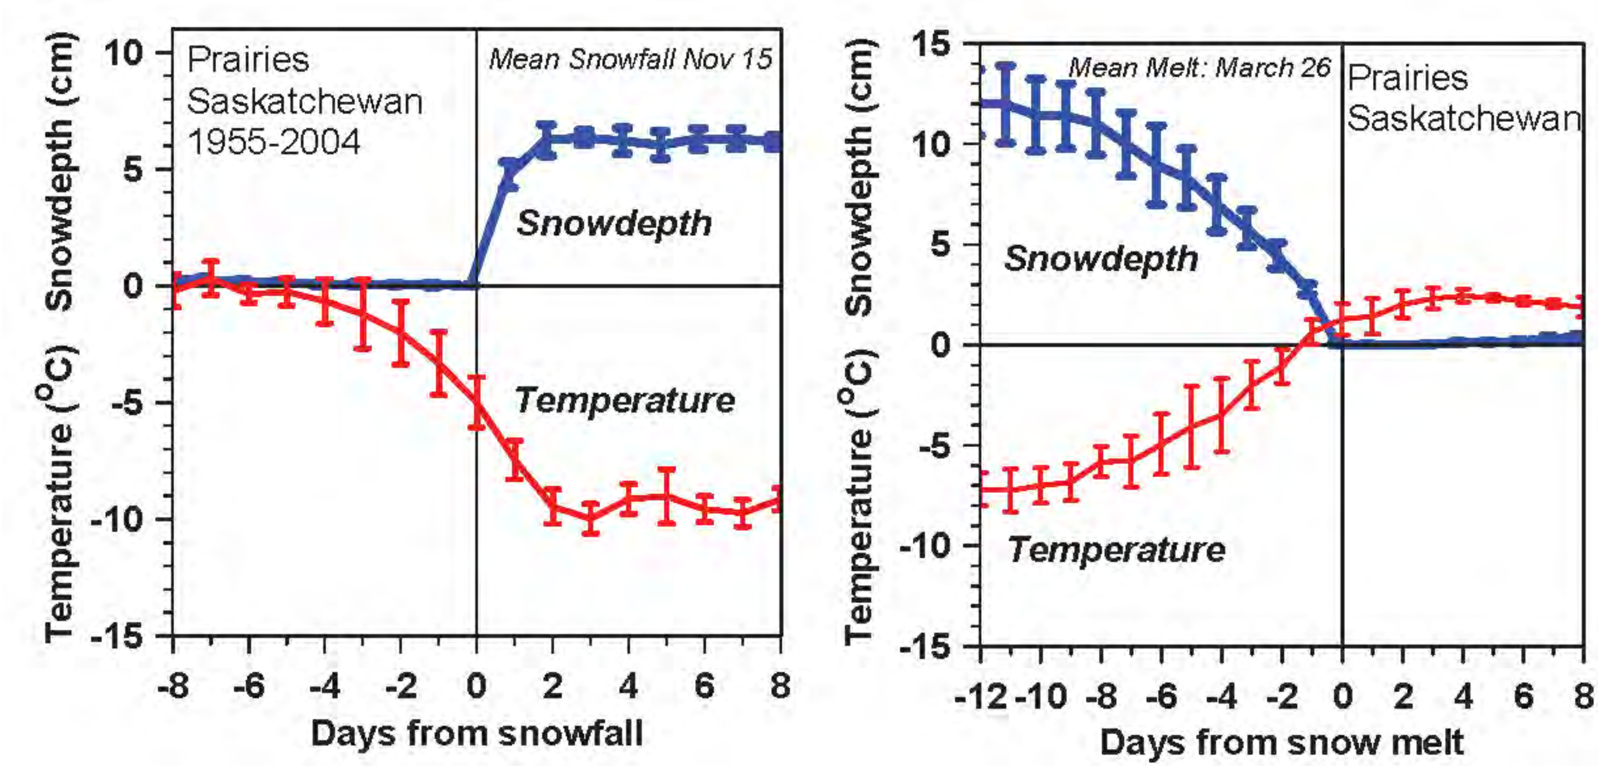
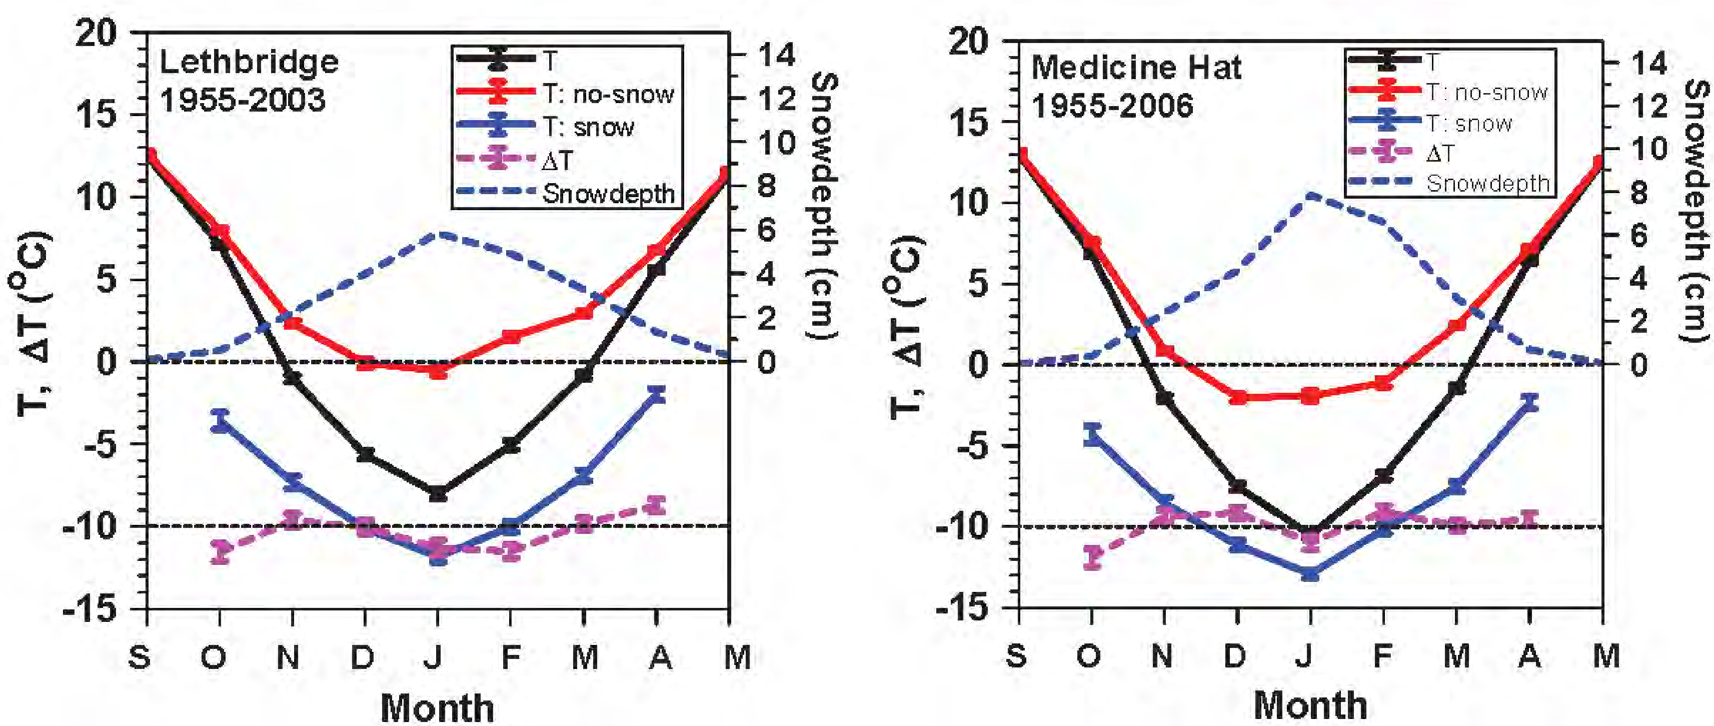
Snowfall and Snowmelt
ΔT Canadian Prairies



- **Temperature falls/rises 10K with first snowfall/snowmelt**
  - ***Local climate switch between warm and cold seasons***

Betts et al. 2014

Impact of Snow on Climate



Separate mean climatology into days with no-snow and snowdepth >0

ΔT = T:no-snow –T:snow = -10.2(±1.1)°C

Betts et al. (2016)

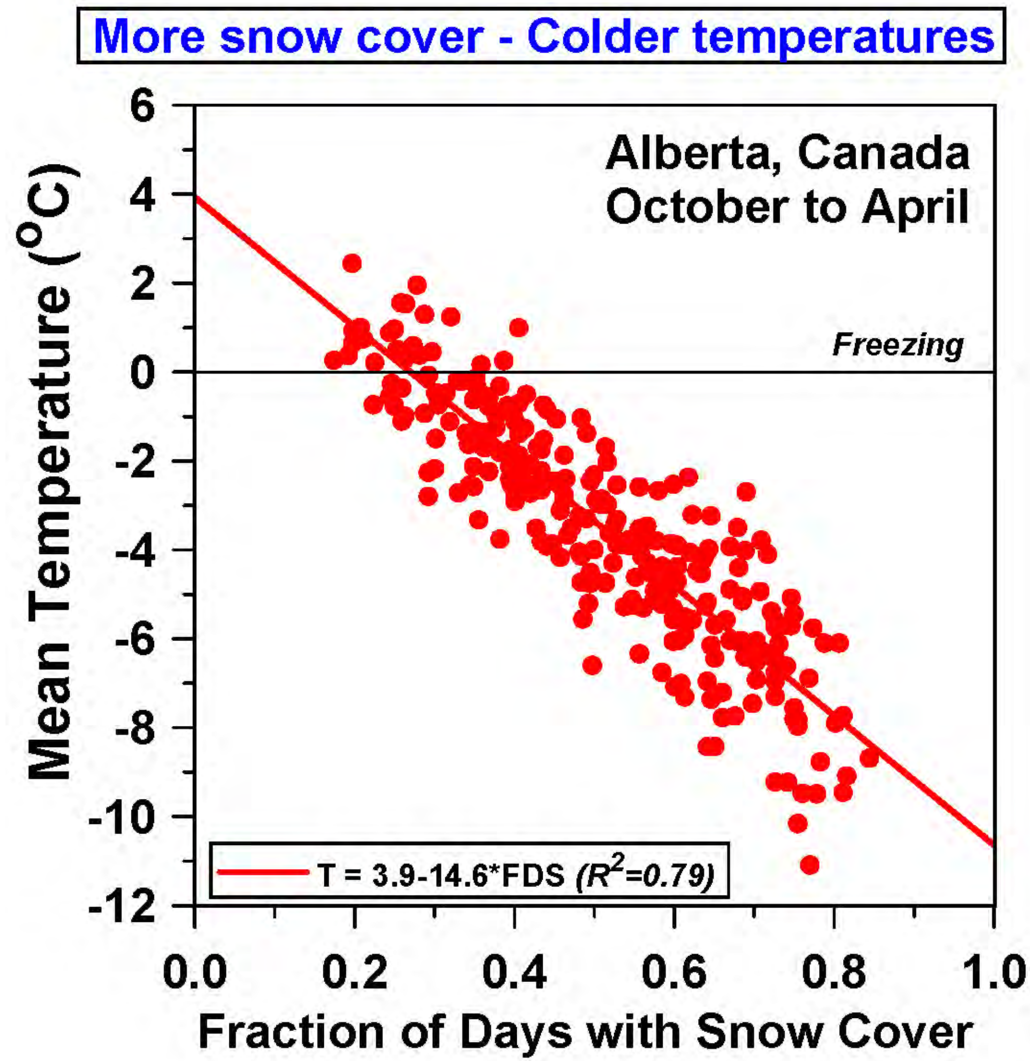
Interannual variability of T coupled to Snow Cover

- **Alberta: 79% of variance**
- **Slope T_m -14.7 (± 0.6) K**

10% fewer snow days

= 1.5K warmer

on Prairies



Diurnal cycle: Clouds & Snow

Canadian Prairies
660 station-years of data

Winter climatology

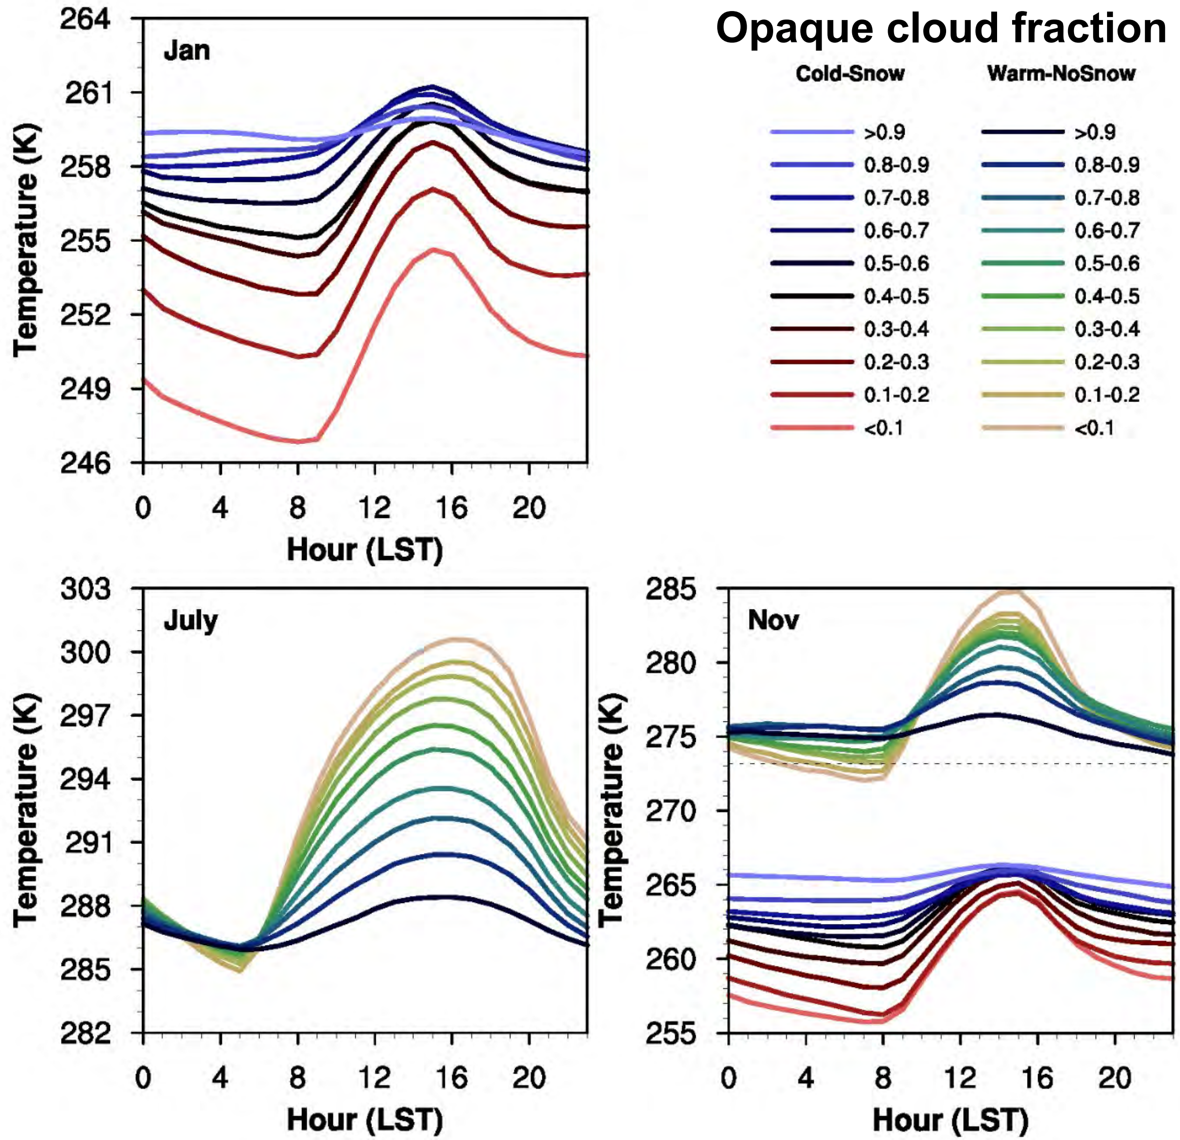
- Colder when clear
- LWCF dominant with snow

Summer climatology

- Warmer when clear
- SWCF dominant: no snow

Transition months:

- Show both climatologies
- With 11K separation
- Fast transitions with snow
- Snow is "Climate switch"



Warm and Cold Seasons

- Unstable BL: SWCF -
- Clouds at LCL
  - reflect sunlight

- Stable BL: LWCF +
- Cloud reduce LW loss
- Snow - reflects sunlight

Impact of Snow

- **Distinct warm and cold season states**
- **Snow cover is the "climate switch"**
- **Prairies: $\Delta T = -10^{o}C$ (winter albedo = 0.7)**
- **Vermont: $\Delta T = -6^{o}C$ (winter albedo 0.3 to 0.4)**

- **Snow transforms BL cloud coupling**
  - **No-snow 'Warm when clear' - convective BL**
  - **Snow 'Cold when clear' - stable BL**

- **Don't average snow/no-snow climates**

Warm Season Climate

(April – October with no snow)

- ***"Climate" historically: T and Precip.***
- ***In the fully coupled system***
  - ***Diurnal cycle of T and RH coupled***
  - ***to Radiation/cloud and Precipitation***
- ***Monthly timescale: strongest link is to cloud but precipitation memory long***

Betts et al. 2014b, 2017

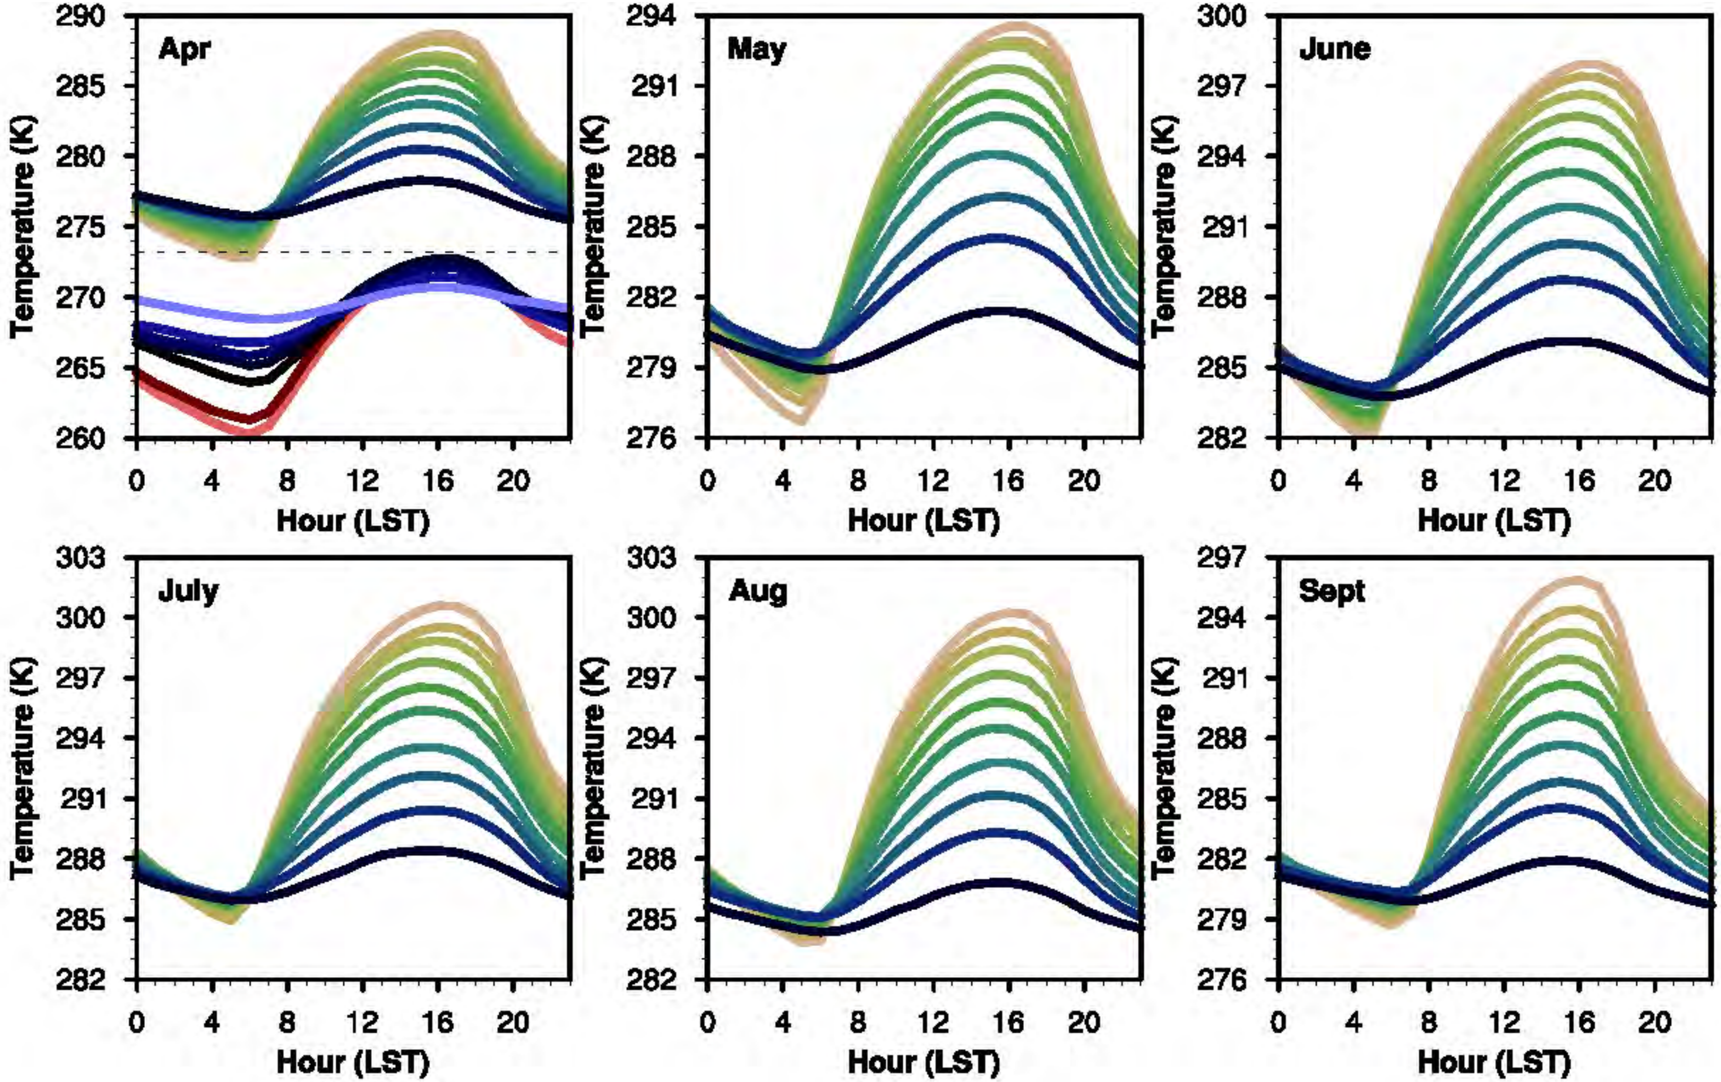
Diurnal Cycle Climate

Diurnal cycle: T, RH, θ_E, P_{LCL}

- **DTR = $T_x - T_n$**
- **DRH = $RH_x - RH_n$**
- **$D\theta_E$, DP_{LCL} similarly**

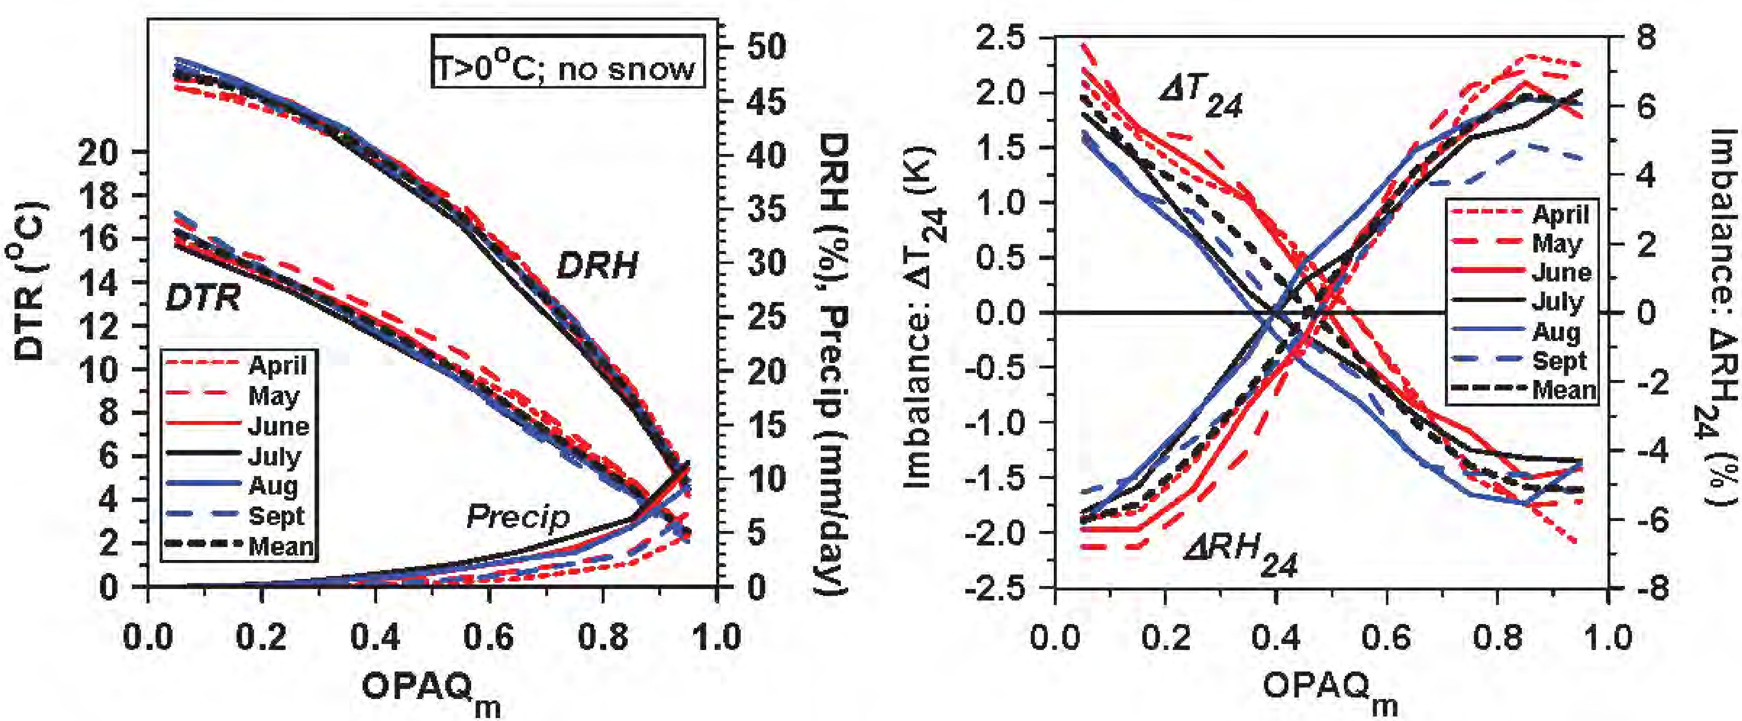
- ***Imbalance of diurnal cycle "climate"***

Monthly Diurnal Climatology:
Dependence on opaque cloud



Q: How much warmer is it at the end of a clear day?

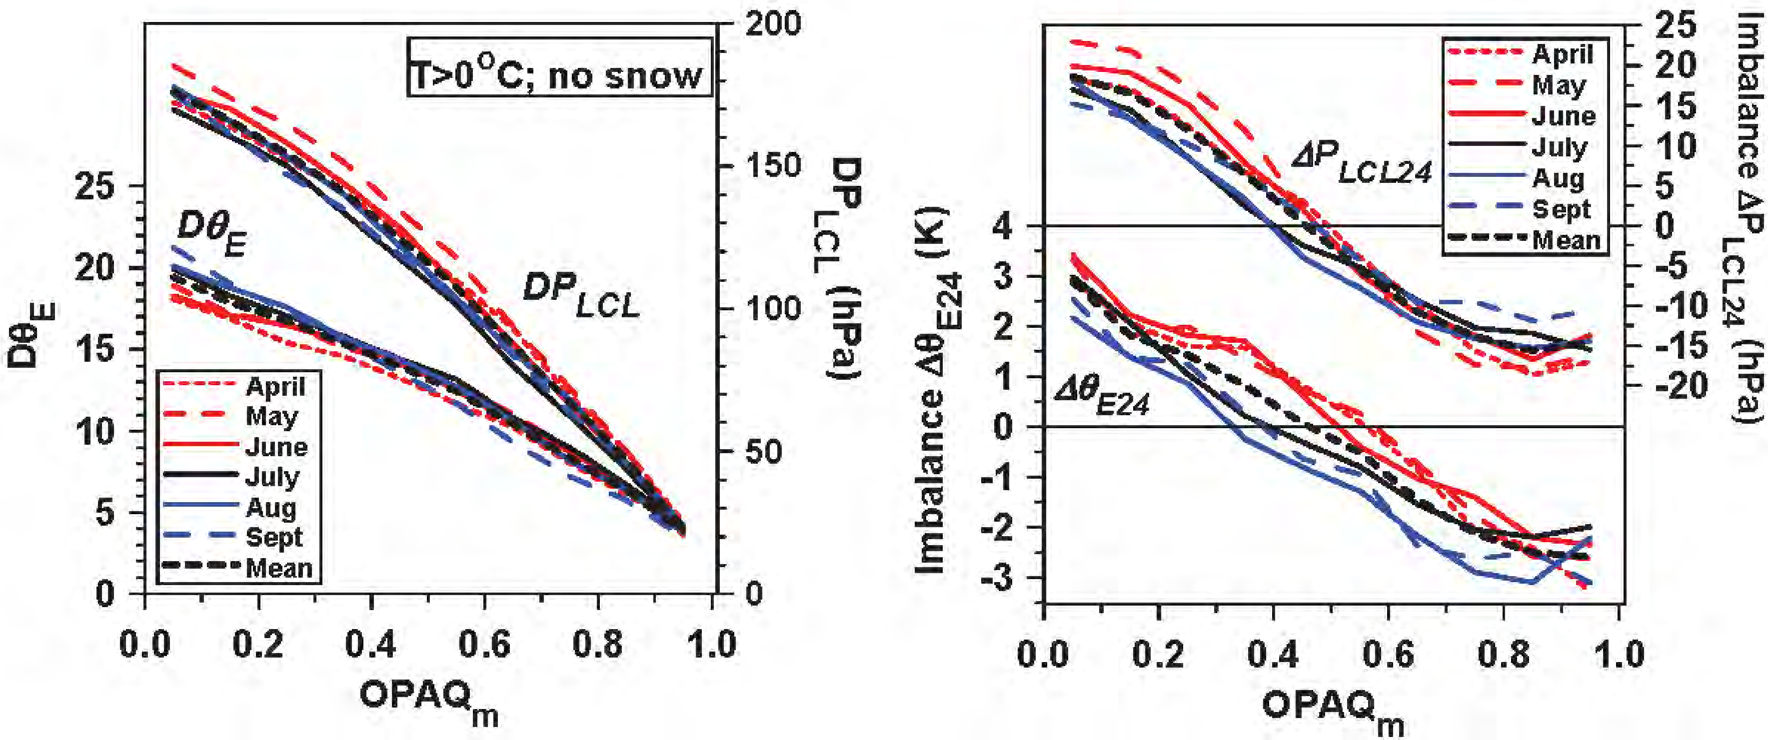
Diurnal Ranges & Imbalances



- April to Sept: ***same coupled structure***
- Q: Clear-sky: warmer (+2°C), drier (-6%)

(Betts and Tawfik 2016)

Diurnal Ranges & Imbalances



- April to Sept: <u>same coupled structure</u>
- Clear-sky: θ_E (+3K), LCL higher (+18hPa)

(Betts and Tawfik 2016)

Multiple Regression on Cloud and lagged Precip. anomalies

- **Monthly anomalies (normalized by STD of means)**
  - **opaque cloud (CLD)** ***(surrogate for radiation)***
  - **precip. (PR-0, PR-1, PR-2): current, previous 2 to 5 months**

δDTR = A*δCLD + B*δPR-0 + C*δPR-1 + D*δPR-2 ...

(Month) (Month) (Month-1) (Month-2)

Soil moisture memory

April: memory of precipitation back to November

June, July, Aug: moisture has memory back to March

April: Multiple Regression on Cloud and Lagged Precipitation

1953-2010: 12 stations (620 months)

Variable $R^2 =$	δDTR 0.67	δT_x 0.47	δRH_n 0.65	δP_{LCLx} 0.66	
Cloud-Apr	**-0.52±0.02**	**-0.78±0.04**	**0.76±0.03**	**-0.93±0.04**	**Dominant**
PR-Apr	**-0.06±0.02**	(0.01±0.04)	**0.20±0.03**	**-0.19±0.04**

April remembers precip. back to freeze-up

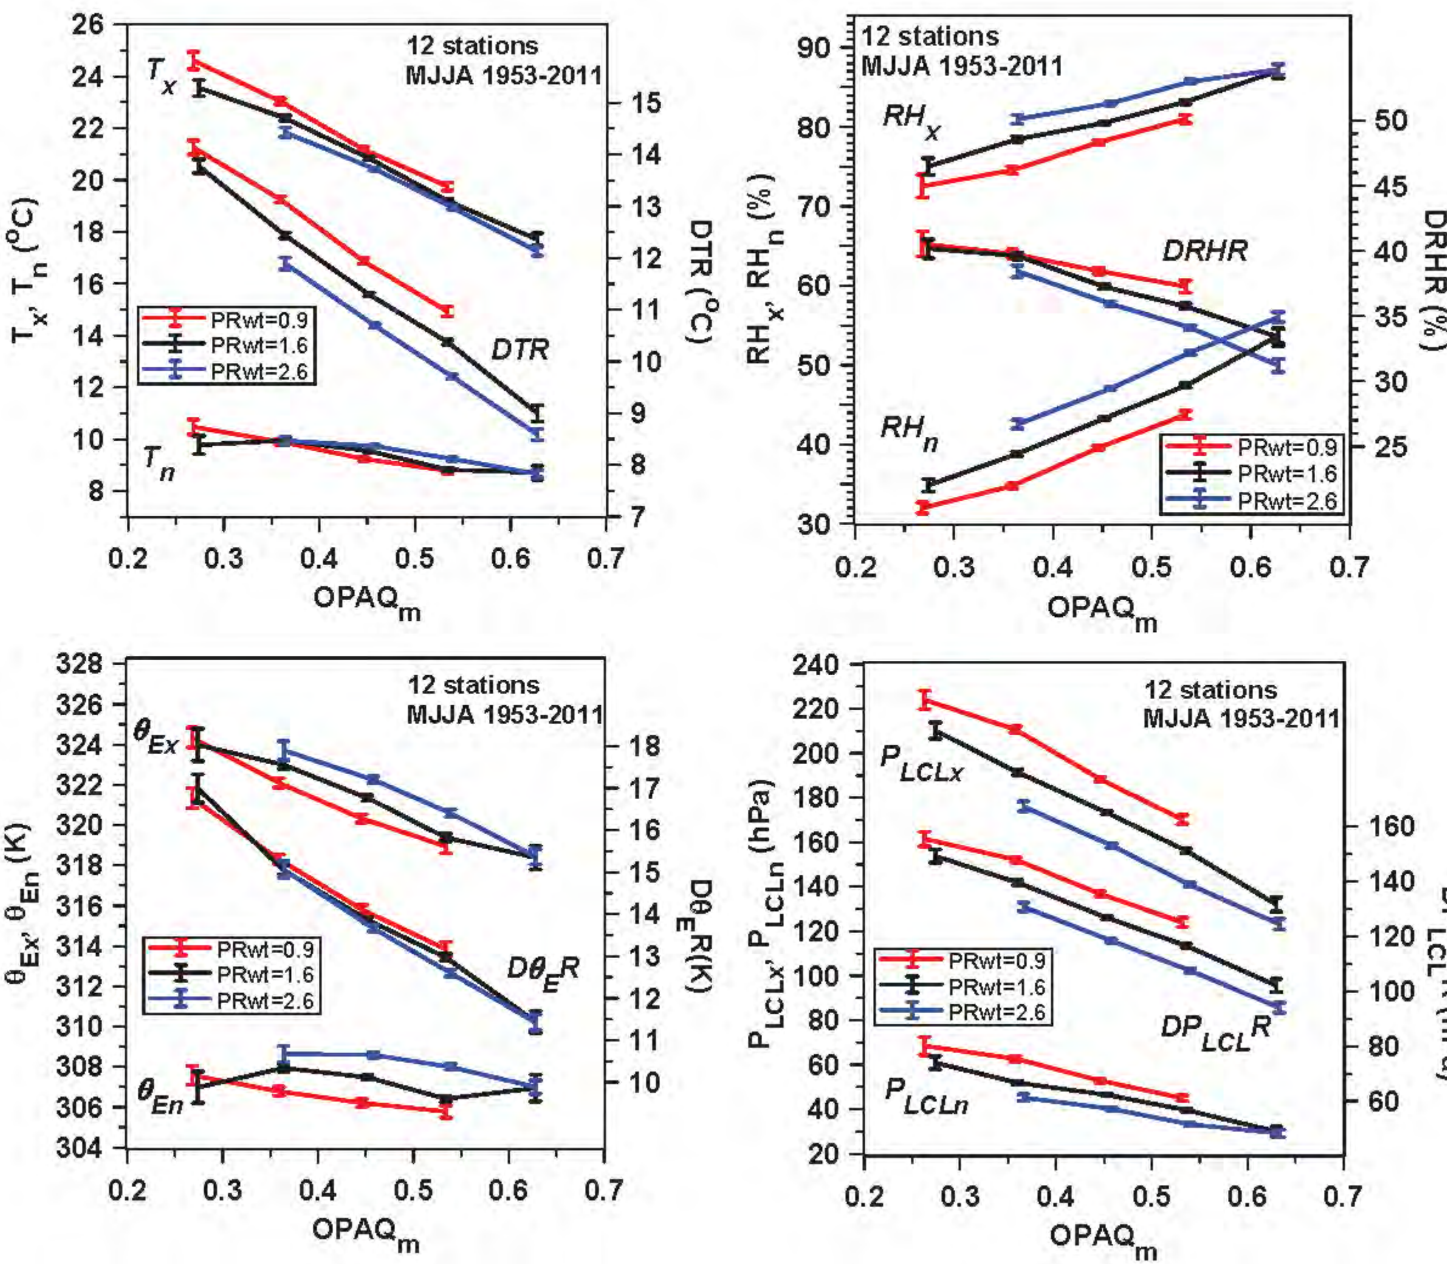
Summer Precip Memory back to March

JULY ***1953-2010: 12 stations (614 months)***

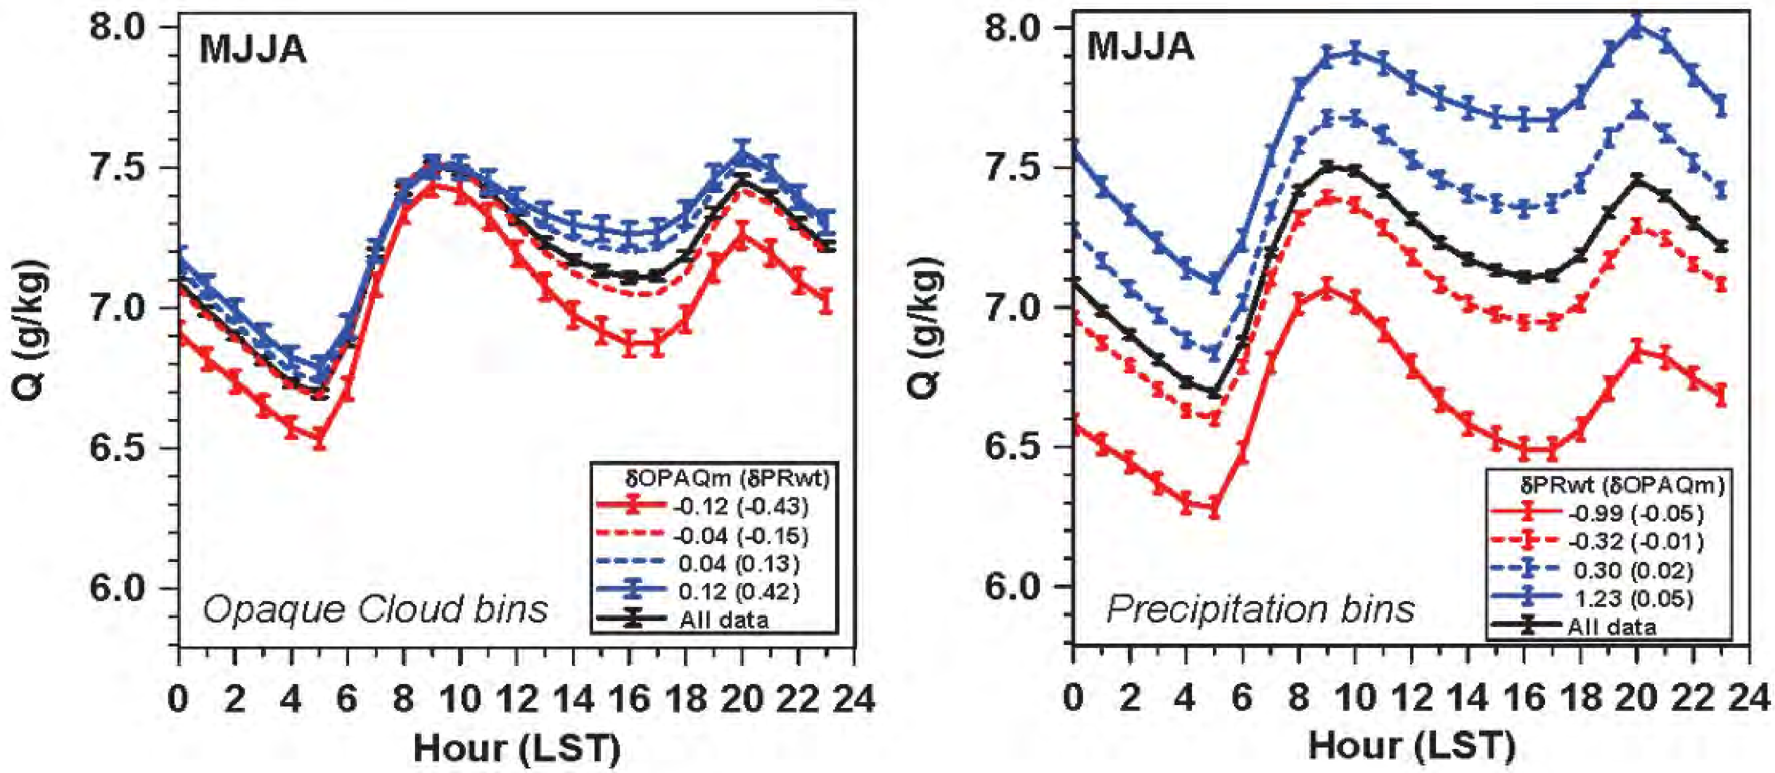
JULY R^2	δDTR 0.68	δRH_n 0.61	δP_{LCLx} 0.62	δQ_{Tx} 0.26
Cloud-July	**-0.56±0.03**	**0.50±0.03**	**-0.63±0.04**	(0.03±0.04)
PR-July	**-0.31±0.02**	**0.37±0.03**	**-0.45±0.04**	**0.34±0.04**
PR-June	**-0.22±0.02**	**0.34±0.03**	**-0.44±0.04**	**0.38±0.04**
PR-May	**-0.12±0.02**	**0.11±0.03**	**-0.16±0.04**	**0.16±0.04**
PR-Apr	-0.04±0.02	0.06±0.03	-0.06±0.03	**0.12±0.04**
PR-Mar		0.06±0.03	-0.07±0.03	**0.10±0.04**

June, July, Aug have precip memory back to March

MJJA on cloud and Precipitation



Diurnal cycle: Mixing Ratio Q



Dependence on cloud small; on precipitation large

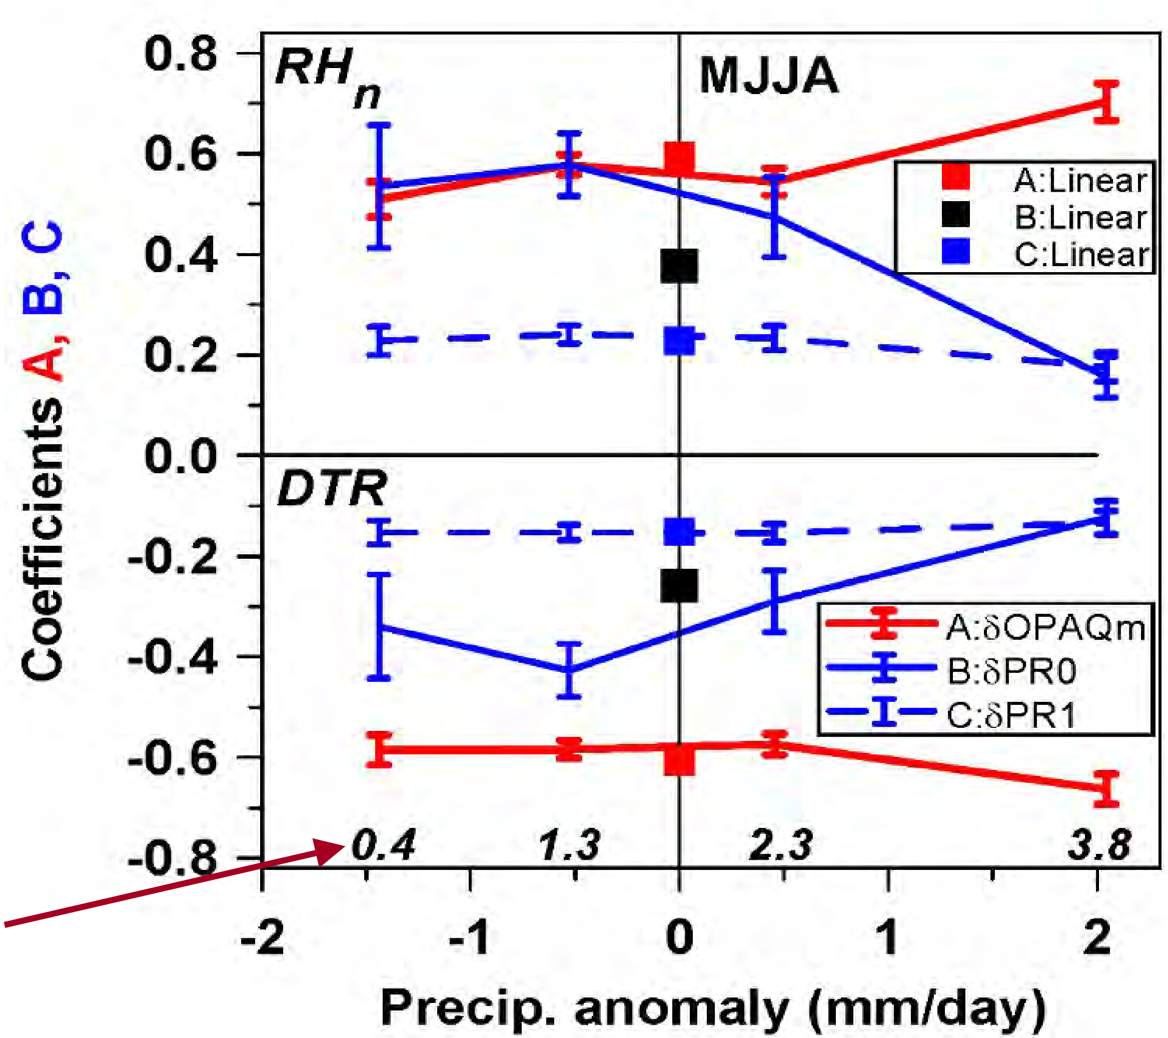
Non-linear coupling to precipitation:

Stratify by precipitation anomaly δPR-0 for current month

A: Opaque cloud
B: δPR-0: this month
C: δPR-1: last month

The solid squares are the A, B, C linear regression coefficients

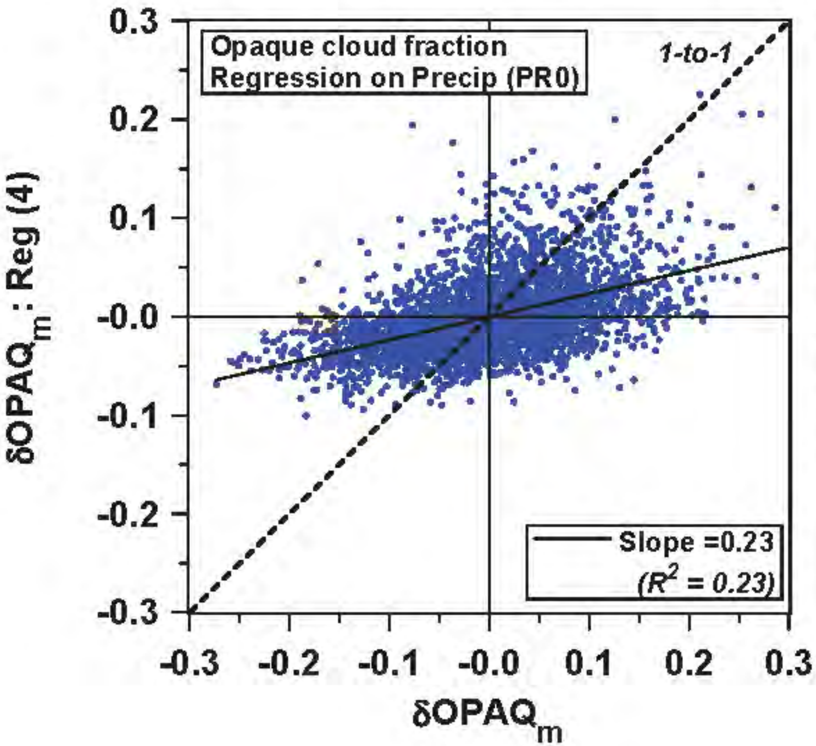
Coupling less in wetter months

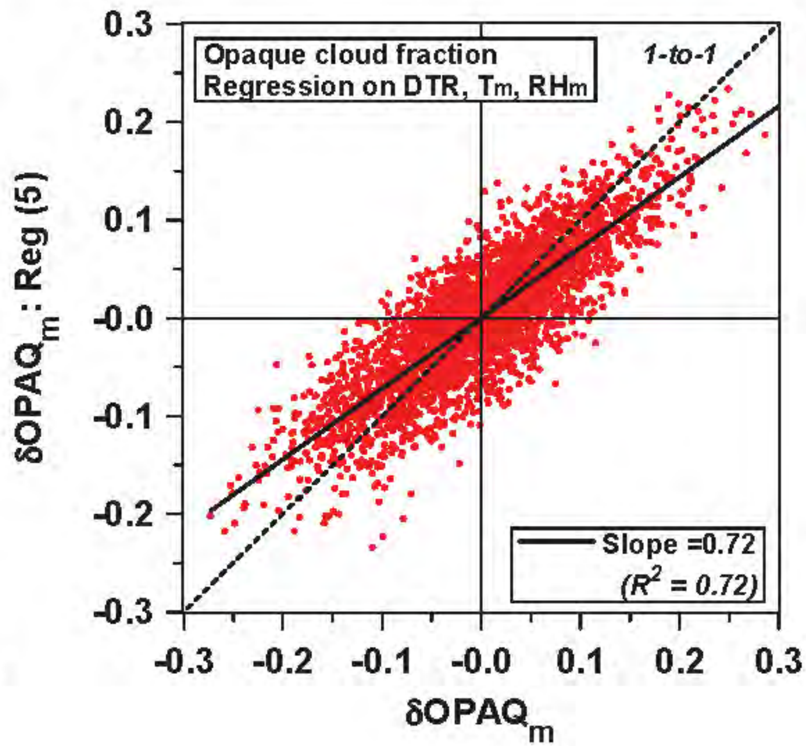


Mean monthly precipitation

Cloud on Climate variables

MJJAS





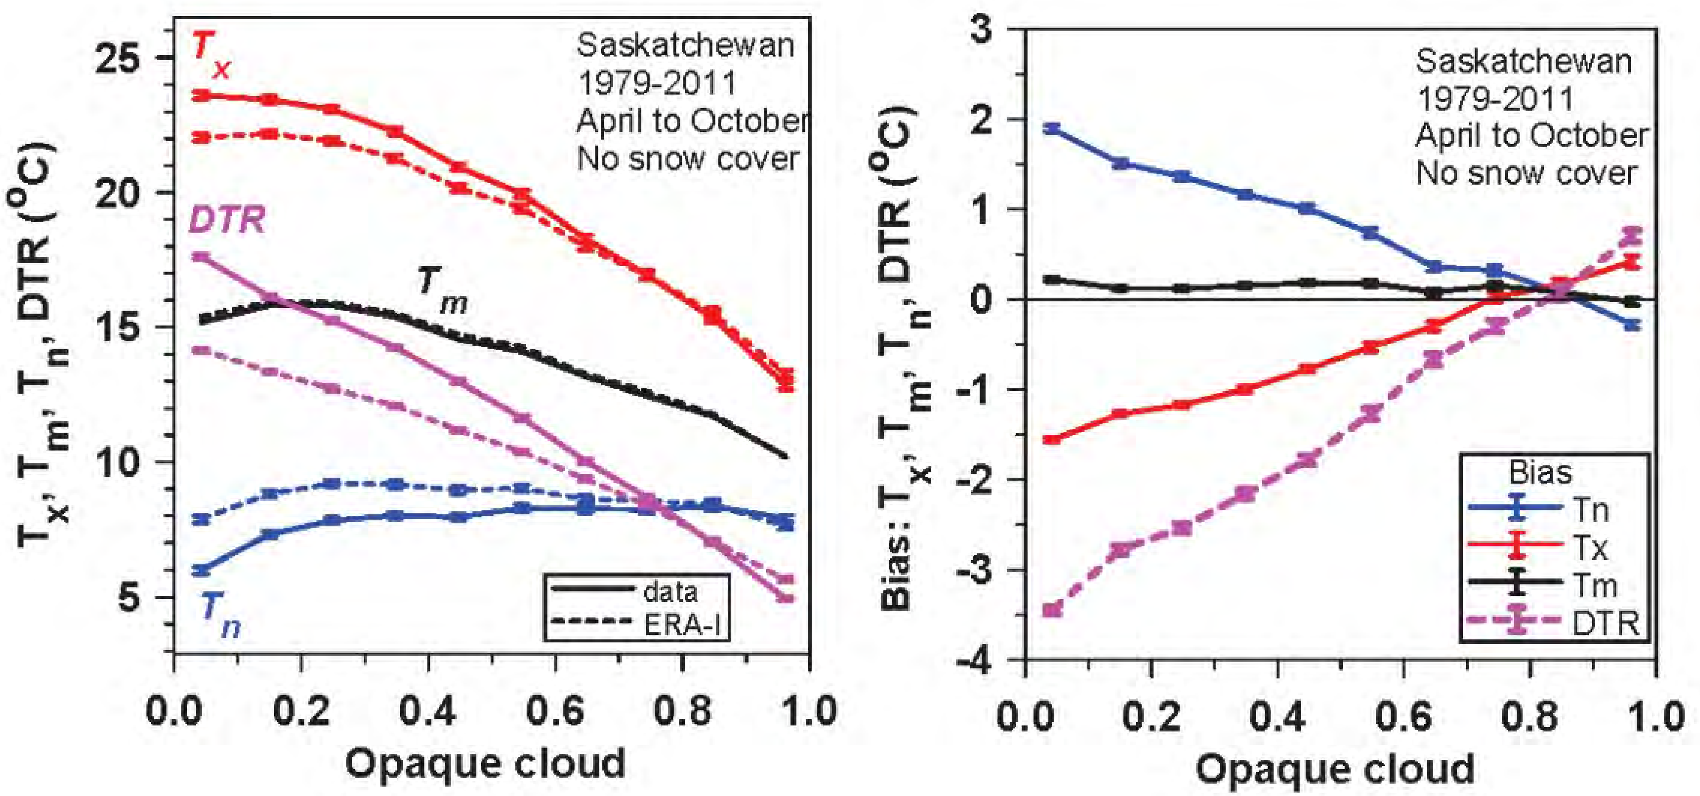
Precipitation

DTR, T_m, RH_m

Conclusions-1

- **Remarkable dataset with opaque cloud**
- **Cloud radiative forcing variability dominates diurnal and monthly timescales**
- **Low wind: greater DTR, θ_{Ex}, Precip.**
- **Warm season precipitation memory back to March (early snowmelt)**
  - **Stronger for moisture variables than DTR**
- **Coupling of monthly climate to precipitation anomalies is non-linear**
- ***Clouds and climate are tightly coupled on monthly timescale***

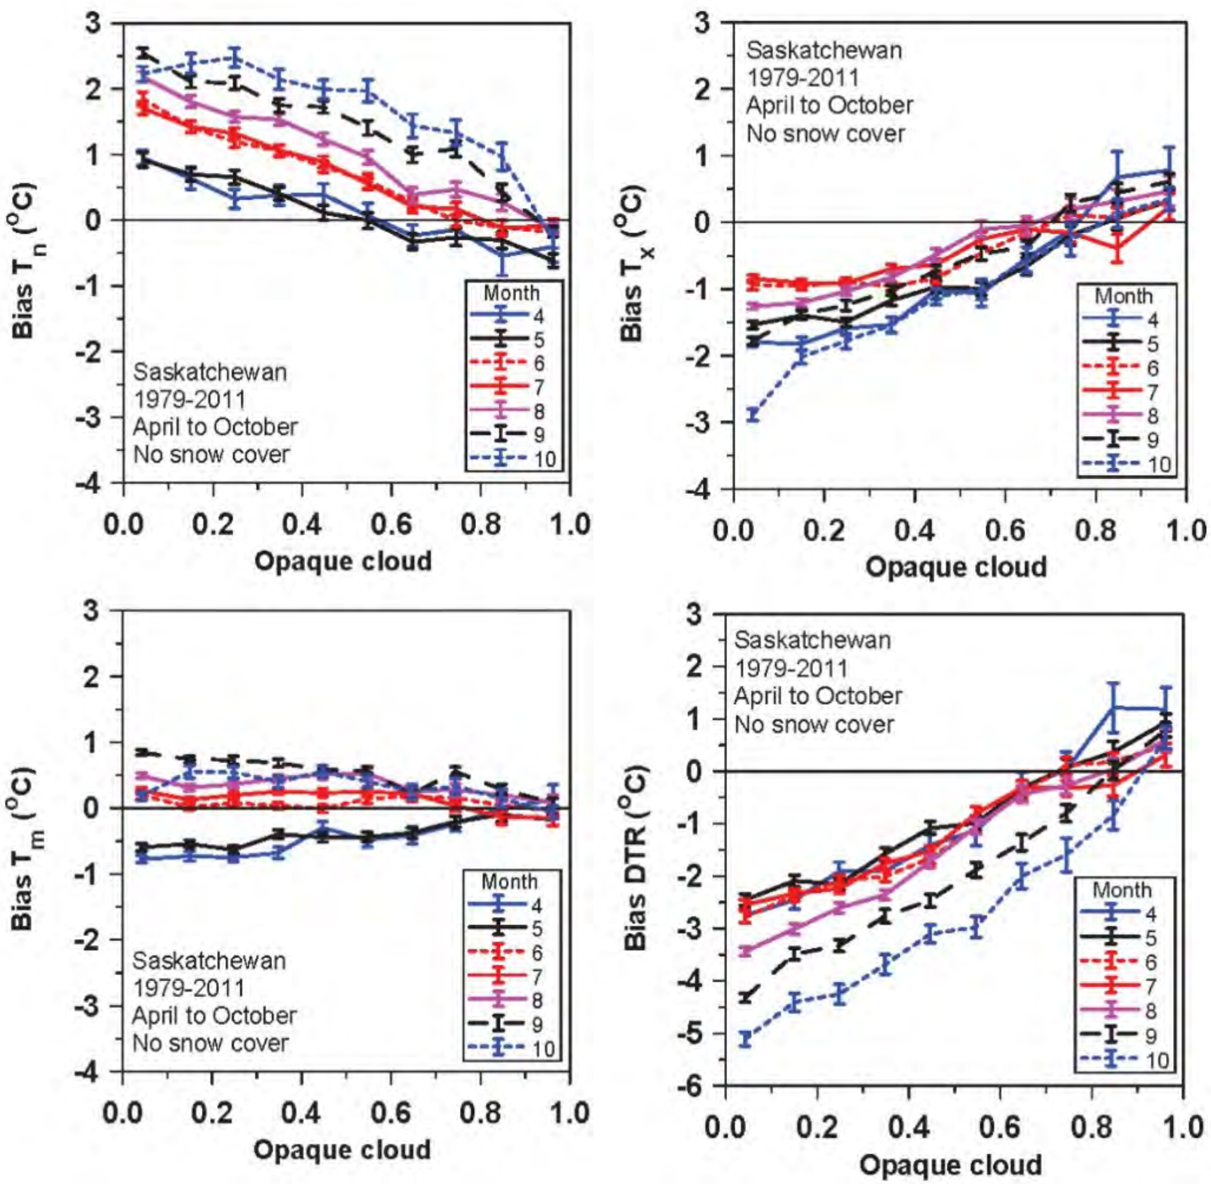
ERA-Interim Biases



- **Warm season (no snow cover)**
  - ***T_x cold, T_n warm; DTR too small***

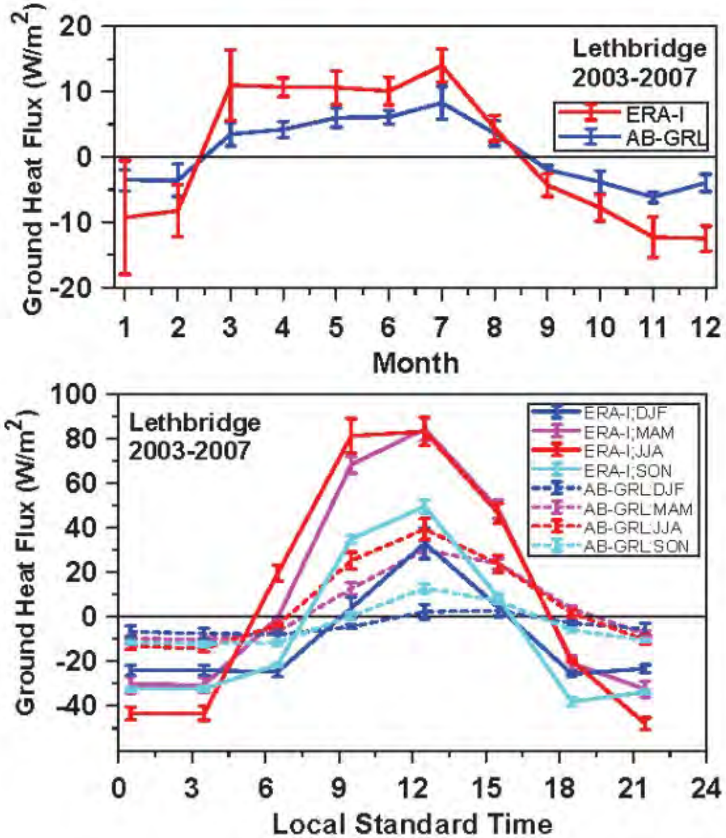
Monthly biases

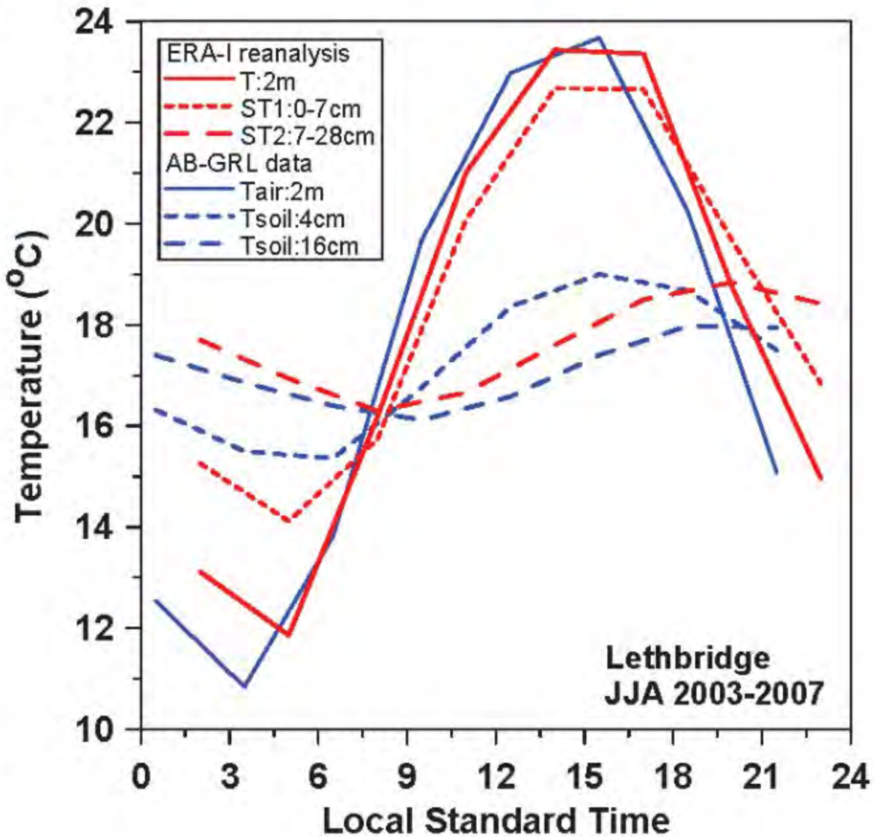
- Seasonal trends large
- bias:T_n increases April to Oct
- bias:T_x min in JJ
- bias:T_m changes sign: spring to fall
- bias:DTR reaches -5°C in Oct



WHY?

Ground coupling too strong

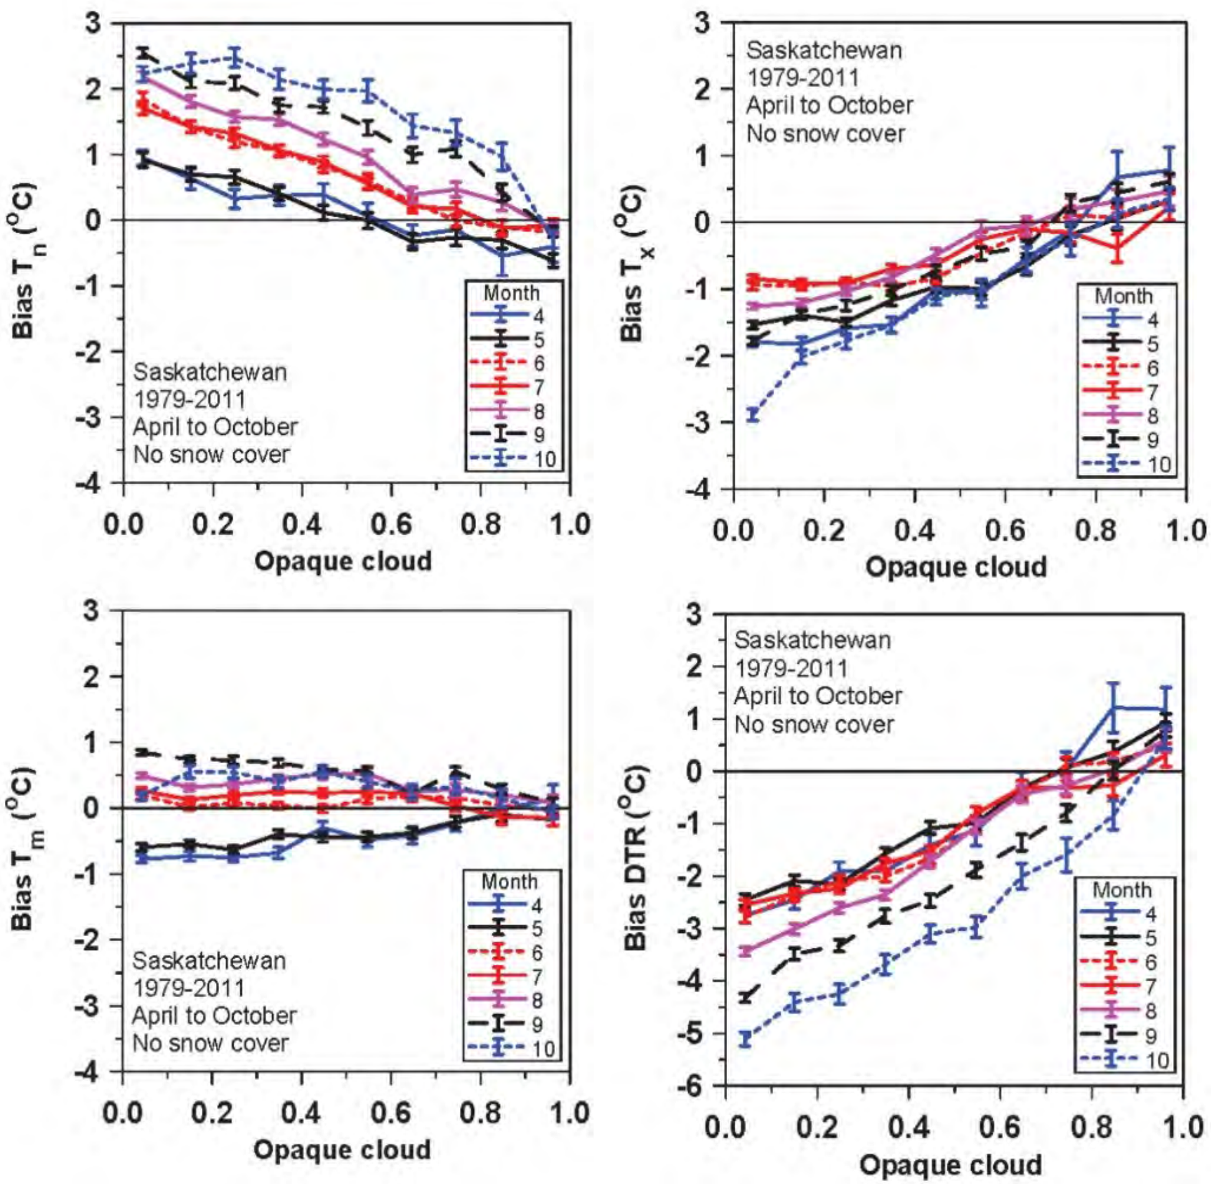




- Diurnal and seasonal ground flux in ERA-I too large
- Ground temperatures too warm in summer

Biases

- T_n warm: ground flux too large at night : ground cold in April, warm in Oct
- T_x cold: ground flux too large in day: G/R_{net} smallest in June, July
- T_m changes sign: ground too cold in spring, too warm in fall



Impact of Snow

- **Distinct warm and cold season states**
- **Snow cover is the "climate switch"**
- **Prairies: $\Delta T = -10^{o}C$ (winter albedo = 0.7)**
- **Snow transforms BL cloud coupling**
  - **No-snow 'Warm when clear' - convective BL**
  - **Snow 'Cold when clear' - stable BL**
- **Don't average snow/no-snow climates!**
